## Comparison between Moulded Cog Construction and Envelope Construction

Designated ZX, AX, BX, and CX in the Classical Vee-belt and XPZ, XPA, XPB and XPC in the Wedge belt.

Moulded Cog raw-edge belts have higher capacity and efficiency, and they can use smaller pulleys than traditional envelope (wrapped) belts.

These belts have a higher coefficient of friction and are more aggressive, which makes them a very efficient belt for power transmission.

Unlike conventional fabric-covered Vee-belts, raw-edge belts have no cover.

Thus, the cross-sectional area normally occupied by the cover is used for more load-carrying cord.

The Cogs on the inner surface of the belt increase air flow to enhance cooler running.

They also increase flexibility, allowing the belt to operate with smaller pulleys.

Because of their higher coefficient of friction, cogged belts tend to be more sensitive to alignment.

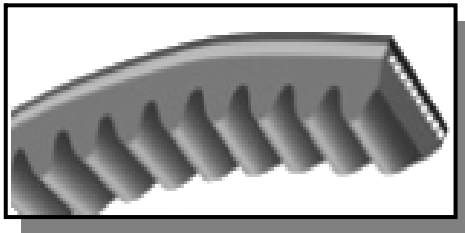

While envelope belts can tolerate some misalignment, cogged belts are more likely to turn over under the same conditions.

Cogged belts should not be used in clutching drives, drives with severe shock loads, and drives that have changing centre distances, such as shaker screens.

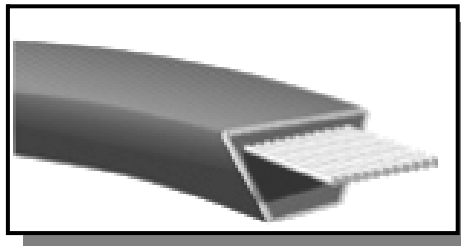

In these applications, the aggressive nature and flexibility of cogged belts can cause vibration, belt turnover, and belt breakage.

Cogged belts should also be avoided in drives that require slippage during frequent stops and starts.
